\(^1\) To be filled in and submitted for each O-SII.
4. Reason for activation of the O-SII buffer

4.1 Scores of concerned institution or group of institutions, as per EBA guidelines on the assessment of O-SIs

</table>

The KNF followed the EBA guidelines. All the criteria, indicators and weights have been applied. Where the data were not available at the highest consolidated level under the KNF jurisdiction, relevant proxies have been used. The threshold has been set at 360 basis points (bps). All banks that meet the definition of 'institutions' contained in Article 4 (3) of the CRR have been included in the calculations and investment firms have been excluded.

The following optional indicator was used to designate this institution:

- Importance for an IPS of which the entity is a member.

4.2 Methodology and indicators used for designation of the O-SII (Article 131.3)

The bank plays a key role in one of the two Institutional Protection Schemes operating in the Polish banking sector. The bank has been obliged to:

- run selected deposit accounts on behalf of the co-operative banks that are united within the IPS,
- monitor certain categories of risk within the IPS,
- monitor liquidity within the IPS on consolidated basis,
- provide technical infrastructure for the IPS.

4.3 Supervisory judgement

The O-SII buffer was calibrated using a proportional method. The buffer was not set for institutions which scored less than the threshold of 350 bps. For institutions scoring no less than 350 bps, the buffer was calibrated in the following steps:

- rounding down the quotient of the score of the institution and 350 to the nearest whole integer: 
  \[(\lfloor x \rfloor = \text{score}/350)\]
- assigning of the buffer proportionally by multiplying the integer from the previous step by 0.25% 
  \[(\lfloor x \rfloor \times 0.25\% )\]
- if the value calculated in step 1 is equal or higher than 5, then the buffer value is set to 2% of total risk exposure calculated in accordance with the CRR.

It should be emphasized that the application of the last step of the above procedure, means departure from the rule of proportionality in determining the O-SII buffer rate. This is because after exceeding a certain size threshold the risk that the institution generates for the financial sector and the real economy, increases non-linearly. Thus, the KNF deemed it appropriate to adopt for this type of institutions the maximum rate of the buffer, i.e. 2% of total risk exposure.

4.4 Calibrating the O-SII buffer

Setting the O-SII buffer will have positive impact on the resilience of the bank to external shocks, as well as the soundness of the overall banking sector and the real economy in Poland. The applied measure is proportional with respect to the overall score of the bank and the level of concentration in the Polish banking sector.

5. Combinations and Interactions with other measures
5.1 Assessment of cross-border effects and the likely impact on the internal market
(Recommendation ESRB/2015/2)

The effects are negligible due to insignificant scale of cross-border activities of the bank.

5.2 Assessment of leakages and regulatory arbitrage within the notifying Member State

The research carried out so far shows no signs of such effects.

6. Combinations and interactions with other measures

| 6.1 Combinations between G-SII and OSII buffers (Article 131.14) | N.a. |
| 6.2 Combinations with SRB buffers (Article 131.14 + Article 133.5) | The systemic risk buffer has not been set in Poland yet. |
| 6.3 O-SII requirement for a subsidiary (Article 131.8) | N.a. |
| 6.4 Interaction with other measures | N.a. |
