	4. Reason for O-SII identi	fication and activation of the O-SII buffer

	Bank Name	Final Score	
4.1 Scores of concerned	Caixa Geral de Depósitos	2561	
institution or group of institutions, as per EBA	Banco Comercial Português	2070	
guidelines on the assessment	Santander Totta-SGPS	1318	
of O-SIIs (Article 131.3)	Novo Banco	1225	
(,	Banco BPI	729	
	Caixa Económica Montepio Geral	461	
	The EBA methodology has been applied to constitutions operating in Portugal using consolid methodology.	-	
	In order to perform the methodology we used th	ne following indicators:	
	- Size: Total assets;		
4.2 Methodology and indicators used for designation of the O-SII	<ul> <li>Importance (including substitutability / financial system infrastructure: value of domestic payments transactions (based on TARGET 2 data), private sector deposits from depositors in the EU, private sector loans to recipients in the EU. In addition, we have also used an optional indicator: geographical breakdown of banks activities (deposits and loans);</li> <li>Complexity / Cross-border activity: value of OTC derivatives (notional), cross-jurisdictional liabilities, cross-jurisdictional claims;</li> <li>Interconnectedness: intra-financial system liabilities, intra-financial system assets, debt securities outstanding.</li> <li>When FINREP data were unavailable, proxies were taken from each bank's financial statements (dated December 2017), supplemented by additional data available in Banco de Portugal.</li> </ul>		
(Article 131.3)			
	Institutions with a score equal or higher than 35 as O-SII.	50 basis points were designated	
4.3 Supervisory judgement	As mentioned in 4.2 we have also used an optional indicator: geographical breakdown of banks activities (deposits and loans) as allowed for in Title III of EBA Guidelines.		

	In order to calibrate the O-SII capital buffer for these institutions, Banco de Portugal has applied the clusters methodology. This calibration approach was also adopted by the BCBS (2013) to calibrate the buffer rates for Global Systemically Important Banks (G-SIBs) and also used by other countries that have already identified the O-SIIs and calibrated the O-SII buffer. O-SII's buffers shall be met in a four year phase-in period that started in January 2018 and will end up in January 2021 aligned with the information provided in point 2.2. Against this background, and taking into account the scores obtained in the					
	identification process, we set up five buckets as follows:					
	i.	i. Bucket 1 encompasses scores from 350 to 699 basis points;				
	ii.	Bucket 2 enco	mpasses scores from 700	) to 1399 basis points;		
	iii.	Bucket 3 enco	mpasses scores from 140	00 to 2099 basis points;		
	iv.	Bucket 4 enco	mpasses scores from 210	00 to 2799 basis points;		
4.4 Calibrating the O-SII buffer	۷.	Bucket 5 enco	mpasses scores above or	equal 2800 basis points.		
	Given the scores underlying each PT O-SII, bucket 5 corresponds to an empty bucket, in the sense that no PT O-SII will be allocated to it. By considering an empty bucket, the competent authority signalizes the market and the O-SIIs that the latter could be asked to comply with a higher rate in the future if they become more systemically relevant, as presented in the following table:					
	O-SIIs distribution by buckets and respective buffers:					
			<b>Buckets/Scores</b>	Capital Buffers		
		5	>= 2800	2.00%		
		4	2100-2799	1.00%		
		3	1400-2099	0.75%		
	_	2	700-1399	0.50%		
	_	1	350-699	0.25%		
	According to Banco de Portugal's macroprudential stance, the O-SII buffer is a suitable instrument to address the macroprudential policy intermediate objective aimed at preventing the building up of systemic risks arising from misaligned incentives and moral hazard. <sup>1</sup> The identification of systemically important institutions (both global and domestic) and the application of stricter capital requirements are based on the following rationale: when taking rational decisions to maximize profits, which can be viewed as optimal at the individual level, systemically important institutions do not internalize the negative externalities these decisions may cause to the financial system. <sup>2</sup> Negative externalities comprise the impact of the failure or impairment of large, complex and interconnected financial system and have					

<sup>&</sup>lt;sup>1</sup> Banco de Portugal (2014), "Macro-prudential policy in Portugal: objectives and instruments".

<sup>&</sup>lt;sup>2</sup> Basel Committee on Banking Supervision (2012), "A framework for dealing with domestic systemically important banks"

	r
	case of G-SIIs, or ii) impact on the domestic financial system and economy, in the
	case of O-SIIs.
	The introduction of the O-SII buffer is thereby suggested as a risk-mitigating
	measure, aiming at enhancing the resilience of the financial system by imposing
	stricter capital requirements to banking groups identified as systemically
	important at the domestic level. According to the Basel Committee on Banking
	Supervision, the main objective of the O-SII capital buffer is to reduce the
	probability of default of this type of institutions compared to non-systemic ones
	given the greater impact an O-SII failure is expected to have on the domestic
	financial system and economy.
	The total assets of Portuguese O-SII reached, in 2017, 82% of the total assets of
	the Portuguese banking sector and represented 162% of the Portuguese GDP.
	Therefore, the relevance of these institutions in the domestic baking system and
	the magnitude of the systemic risk that they may pose to the Portuguese
	economy are clear. Thus, the need for a capital buffer targeted to these
	institutions is largely justified.
5. Cross-border and cross	-sector impact of the measure
	According to Recommendation ESRB/2015/2, the relevant activating authorities
	are recommended to assess, prior to their adoption, the cross-border effects of
	the implementation of their own macroprudential policy measures. In order to
	perform that assessment the spillover channels operating via risk adjustment
	and regulatory arbitrage should be gauged using the methodology set out in
5.1 Assessment of cross-	Chapter 11 of the ESRB Handbook. These spillovers are split in two types: cross-
border effects and the likely impact on the internal market	border effects of the implementation of macroprudential measures that affect
(Recommendation	the activating authorities (also known as inward spillovers) and those cross-
ESRB/2015/2)	border effects that impact the Single Market (also known as outward
	spillovers). In this vein, only the cross-border spillovers to other European Union
	Members States are assessed.
	In order to perform the assessment of the potential cross-border effects leakages
	and regulatory arbitrage of the macroprudential measure at hand we use the
	framework and the indicators, whenever available, set out in the Chapter 11 of
	the ESRB Handbook.
5.2 Assessment of leakages	The scope for "leakages" is limited in the sense that:
and regulatory arbitrage	<ul> <li>This measure will be applied on a consolidated basis;</li> </ul>
within the notifying Member	• In Portugal the non-banking part of the financial system has a relatively
State	small dimension and Banco de Portugal does not expect a material shift
	to other bank and non-bank financial entities.
6. Combinations and inter	ractions with other measures
6.1 Combinations between G-	In case both G-SII and O-SII criteria applied to the same institution at the
SII and OSII buffers (Article	consolidated level, which of the two buffers is the highest?
131.14)	N/A

6.2 Combinations with SRB buffers (Article 131.14 + Article 133.5)	No Portuguese O-SII is subject to a systemic risk buffer.	
	a. Does the combined buffer requirement apply to the institution?	
6.3 Combined buffer requirement	The O-SIIs identified are subject to the Capital Conservation Buffer as envisaged in CRD IV.	
(Article 131.16 and Article 131.17)	b. Is the combined buffer requirement above the sum of the buffers described in Article 131-16 and Article 131-17?	
	Following previous answer this is not applicable.	
	In case the O-SII is a subsidiary of an EU parent institution which is subject to a G-SII or O-SII buffer on a consolidated basis, what is the G-SII or O-SII buffer rate on a consolidated basis of the parent institution?	
	Santander Totta SGPS is a subsidiary of a Spanish parent institution (Banco Santander, S.A.) which is a G-SII in Spain whereas Banco BPI is a subsidiary of a Spanish parent institution CaixaBank, S.A. which is an O-SII in Spain.	
6.4 O-SII requirement for a subsidiary (Article 131.8)	The proposed O-SII buffers (0.5% on a sub-consolidated basis as of 1 January 2021) complies with Article 131.8 of CRD IV, since it is below the limits foreseen in this Article.	
	In the case of Santander the (indicative) G-SII buffer required for the same period to the Spanish parent institution is 1% (see the Financial Stability Board 2017 update of list of global systemically important banks - http://www.fsb.org/wp-content/uploads/P211117-1.pdf) assuming that the decision regarding the G-SII buffer rate will remain unchanged.	
	In what regard CaixaBank, S.A. the institution has to comply with an O-SII buffer of 0.25% (as of 1 January of 2019) which is below the buffer ascribed to Banco BPI (see point 2.2). In this case, the 1% limit is applied.	
	How does the buffer requirement interact with other measures addressing the	
	same risk (e.g. with other supervisory measures)?	
6.5 Interaction with other	The introduction of the Bank Recovery and Resolution Directive (BRRD), which	
measures	establishes new rules to resolve and manage crisis of financial institutions	
	addresses in some extent the same risks, given that this new framework aims to	
	mitigate the assumption of (implicit) government guarantees mainly associated to systemically important institutions.
